

Business Requirements Document — AI Travel Planner (7-Day Demo)

Document Version	2.0 (Demo Scope)
Document Type	Business Requirements Document — cut down from BRD v1.0
Delivery Window	7 working days
Primary Users	Traveler, Administrator
Demo Goal	Show an AI-generated, chat-editable itinerary that can be saved and emailed

1. Purpose of This Version

BRD v1.0 describes the full product. This version keeps only what a 7-day demo can build and still tell a complete story: **describe a trip → get an AI itinerary → change it by chatting → save it → receive it by email**. Everything else moves to the backlog in section 7.

2. The One Sentence to Demo

"I type where I'm going, the AI writes a day-by-day plan, I tell it to make Day 2 less busy, and the updated itinerary arrives in my inbox."

If a feature does not serve that sentence, it is out of scope.

3. In Scope — Critical Features

ID	Requirement	Why it's critical
FR-01	Simple login (email + password, seeded demo accounts)	Trips must belong to someone
FR-02	Create a trip: name, destination, start/end date, travellers, budget, currency	The AI's input
FR-03	Basic preferences: travel style, 3-5 interests, food preference	Makes output feel personalised
FR-04	AI itinerary generation — day-by-day plan with activity, time, duration, estimated cost, short reason	The core of the demo
FR-05		The differentiator

ID	Requirement	Why it's critical
	AI chat box — natural-language changes ("make Day 2 less busy", "remove shopping", "make it suitable for children") using current itinerary + preferences as context	
FR-06	Updated itinerary visibly reflects the chat change	Proves the AI actually acted
FR-08	Save a trip, reopen it, delete it	Proves persistence
FR-09	Email the itinerary to the logged-in user, one button	Requested as a core demo feature
FR-10	Simple feedback: 1–5 star rating + comment on an itinerary	Feeds the SDLC story
FR-11	Minimal admin page: list of users, trips and feedback	Shows the management view

Non-functional, demo level: passwords hashed; API keys in configuration, not in code; a trip survives an application restart; AI and email kept in their own service classes so providers can be swapped; a clear fallback message if the AI call fails.

4. Out of Scope for the Demo

Budget optimisation and cost-vs-budget analysis (show estimated total only) · AI feedback analysis · destination management CRUD · search and filtering · sharing to a third party's email · trip reminders · notification configuration · consultant role · profile editing · accommodation and activity preference detail · move-activity-to-another-day · partial/per-day regeneration (regenerate whole trip only).

5. Seven-Day Plan

Day	Deliverable
1	Project skeleton, database schema (User, Trip, Itinerary, ItineraryItem, Feedback), login, seeded demo users
2	Trip creation form + preferences, trip list, save/reopen/delete
3	AI service: prompt design, structured JSON itinerary, parse and store; itinerary display
4	Chat box: send message with itinerary + preferences as context, apply returned changes, show the updated plan
5	Email service (itinerary as formatted email), feedback form, minimal admin page
6	End-to-end pass, AI failure fallback, loading states, seed one polished sample trip, tidy the UI
7	Buffer, rehearse the demo script, fix what the rehearsal breaks

Days 3 and 4 carry the most risk. Prompt design and reliable JSON output usually take longer than expected, so protect those two days and cut from Day 5 if needed.

6. Demo Acceptance Criteria

1. Log in as the demo traveller.
2. Create *Tokyo Family Holiday, 10-17 Oct 2026, 4 travellers, USD 5,000*.
3. AI returns a day-by-day itinerary with times, costs and reasons within ~30 seconds.
4. In the chat box, ask to make Day 2 less busy — the itinerary visibly changes, the rest stays.
5. Ask to make the trip suitable for children — preferences are retained.
6. Save, return to the trip list, reopen the trip and see the saved version.
7. Click **Email itinerary** and show the email arriving.
8. Submit a rating and comment.
9. Open the admin page and show the trip and the feedback.
10. Name two changes that came from customer feedback and were shipped (e.g. chat box in Release 3, email in Release 5) to tell the SDLC iteration story.

7. Backlog (Post-Demo Releases)

Budget optimisation · AI feedback analysis and themes · destination management · search and filters · sharing and reminders · configurable notifications · consultant review workflow · weather, maps, flights and hotels · multi-language · mobile app · booking provider integration.

8. Risks

Risk	Mitigation
AI returns unparseable or inconsistent output	Demand strict JSON, validate, retry once, then show a fallback plan
Chat changes rewrite the whole trip	Send the current itinerary as context and ask for the changed days only
AI latency spoils the demo	Pre-seed one generated trip as a backup; show a progress state
Email deliverability on demo day	Use a proven provider, verify the sender domain, test to the actual demo inbox on Day 5
Scope creep from BRD v1.0	Section 4 is the agreed exclusion list; anything new goes to section 7
